

ENERGY SUPPLY SOLUTIONS

At GBP Energy we understand the impact of energy bills on your commercial or industrial enterprise. As energy consultants and agents for energy procurement, we use our affiliation with brokerage platforms to reach an extensive group of energy suppliers in the United States and Canada, and secure cost effective solutions for your needs (electricity or natural/propane gas).

- Receive customized solutions. We analyze your energy consumption history and future needs. Receive rates and explore options in your deregulated energy market with projected savings on your current energy bill.
- The transition for changing energy supply is seamless. Your transmission and distribution energy bill continues to come from your local utility provider. Same reliability and quality.

Any business can reduce overhead and operating costs by paying less for energy. So, what changes?

- Your energy rate will go down, and terms adjusted to your needs.
- Another change is the source of your energy. Your local utility provider will obtain the energy from the supplier or generating company specified. In a deregulated market, the consumer has the choice to shop for an energy provider, and choose different products, such as energy from renewables (solar and wind).
- You don't have to worry about service interruptions when you switch energy suppliers because your local utility provider will handle the details. They are still responsible for distributing energy commodities to your business, regardless of the supplier that you choose. The only difference is that the supply price is not set by your utility provider.
